Mathematics of Image and Data Analysis Math 5467

## Introduction

Instructor: Jeff Calder Email: jcalder@umn.edu

http://www-users.math.umn.edu/~jwcalder/5467

### **Course Information**

- University Covid Policy Click Here.
  - Everyone must be vaccinated.
  - Wear a mask.
  - Stay home if sick or isolating due to an exposure.
- Class will be hybrid Zoom/In-person
  - Zoom link will be available via email/Google Calendar.
- Main course website: http://www-users.math.umn.edu/~jwcalder/5467
- Piazza for Q/A: https://piazza.com/umn/spring2022/math5467
- Office hours are TBD.
- 4 homework assignments and 3 projects.
- Take home exam over 2 days.

## Expectations for Hybrid Classes

- Attend in person if you are healthy and not isolating. Otherwise attend over Zoom.
- On Zoom, keep your video on and be attentive during class.
- Lectures will be interactive, and involve working together in groups in-person or within Zoom breakout rooms.
- Lectures will not be recorded, since students are expected to attend and engage.
- Ask questions and interact with your peers!

### Audio signals

Figure 1: Example of a stereo audio signal from a piece of classical music. The left figure shows both channels over the whole song, while the right figure shows a short clip.

## Audio signals

• CD audio has 44,100 samples per second (Hz), with 2 channels and 16 bits per sample

- In terms of kilobits (kbit), 1,411 kbit/sec.
- In terms of megabits (Mbit), 1.4 Mbit/sec.
- How many Mbits or MB of space would a 4 minute song take up?
  - -1 MB = 8 Mbit

# Audio signals

#### Questions:

- How to compress audio without destroying sound quality?
- How to determine what is said in an audio sample? (or determine which song is playing)
- How to demix or remove noise?

### Images

Figure 2: Example of a grayscale digital image.

### Images

- Modern smartphone can have 12 million pixels (MP).
- For a color image this means storing 36 million numbers.
- With 8-bits per sample, this takes 36 MB of space.
- How much space would a color image from a 46 MP camera take up?

## Images

#### Problems in image analysis:

- Compression
- Segmentation
- Inpainting
- Denoising, deblurring
- Classification
- Recognition

### Data analysis

MNIST dataset

## Data analysis

#### Problems in data analysis:

- Classification
- Clustering
- Ranking
- Dimension reduction...

## Overview of course

- Data analysis
  - Principal component analysis (PCA)
  - k-means clustering
  - Spectral clustering
  - Google's PageRank
- Fourier Analysis
- Wavelet Analysis
- Variational methods
- Machine learning
  - Basic algorithms
  - Graph-based learning
  - Neural networks
  - Convolutional neural networks

# Python

- We will use Python for computational examples during class, and students will use Python on homework assignments and for projects.
- Course website has information for how to get access to Python.
- We will cover an introduction to Python in the first 2 weeks.
- To start today: Introduction to Python

### Linear algebra review

- Capital letters A, B, C for matrices (entries are A(i, j))
- Lower case letteers  $x, y, z, x_1, x_2, x_3, x_4, \ldots$  for (column) vectors.
- $e_1, e_2, \ldots, e_n$  are the standard basis vectors in  $\mathbb{R}^n$ .
- Matrix multiplication: A is  $m \times n$  and B is  $n \times p$  then C = AB is the  $m \times p$  matrix with entries

$$C(i,j) = \sum_{k=1}^{n} A(i,k)B(k,j).$$

- $A^T$  denotes the transpose of A.  $A^T(i_{j}) \equiv A(j_{j}, l)$
- Dot product  $x^T y = \sum_{i=1}^n x(i)y(i)$ .
- Norm:  $||x|| = \sqrt{x^T x} = \sqrt{x(1)^2 + x(2)^2 + \dots + x(n)^2}.$
- Algebra:  $\|x \pm y\|^2 = \|x\|^2 \pm 2x^T y + \|y\|^2$ .  $(\chi + \gamma)^T (\chi + \gamma)$

### Rank-one matrix

For vectors x, y of length n, the rank-one matrix  $A = xy^T$  is the  $n \times n$  matrix with entries

ux1 / Ixn

$$A(i,j) = x(i)y(j).$$

It is called rank-one since the range of A is one dimensional and spanned by the vector x. Indeed,

$$Az = xy^T z = (y^T z)x$$

for any vector z.

### Exercise

Let  $x_1, x_2, x_3, \ldots, x_m$  be a collection of vectors of length n. Define the  $m \times n$  matrix

 $X = \begin{bmatrix} x_1 & x_2 & \cdots & x_m \end{bmatrix}^T = \begin{vmatrix} x_1^1 \\ x_2^T \\ \vdots \\ T \end{vmatrix}.$ w that  $\sum_{i=1}^{m} x_i x_i^T = X^T X.$   $X^T X v = \begin{bmatrix} X, X_2 \cdots X_m \end{bmatrix} \begin{bmatrix} x, T \\ x_2 \\ \vdots \\ x_m \end{bmatrix} v e^{-1}$   $m x^1$   $m x^1$   $m x^1$  (vector)Show that  $= \left( \begin{array}{c} X_{1} \\ X_{2} \\ X_{2} \\ \end{array} \right) \left[ \begin{array}{c} X_{1} \\ X_{2} \\ X_{2} \\ \end{array} \right] \left[ \begin{array}{c} X_{1} \\ X_{2} \\ X_{2} \\ \end{array} \right]$ 

L XTJ) Scala  $= \int_{-\infty}^{\infty} (x_{1}^{T} v) x_{1} = (x_{1}^{T} v) x_{1} + (x_{1}^{T} v) x_{2} + \cdots$ + (xm) Xn  $\sum_{i=1}^{\infty} X_{i} X_{i}^{\top} V$  $=\left(\sum_{i=1}^{m} X_{i} X_{i}^{T}\right) V$ Since this holds for every V,  $\chi^{\top}\chi = \sum_{i=1}^{\infty} \chi_{i}\chi_{i}^{\top}$
