

# Introduction to Partial Differential Equations

Peter J. Olver  
School of Mathematics  
University of Minnesota  
Minneapolis, MN 55455  
olver@math.umn.edu  
<http://www.math.umn.edu/~olver>

## Table of Contents

### Chapter 1. What Are Partial Differential Equations?

Classical Solutions  
Initial Conditions and Boundary Conditions  
Linear and Nonlinear Equations

### Chapter 2. Linear and Nonlinear Waves

2.1. Stationary Waves  
2.2. Transport and Traveling Waves  
    Uniform Transport  
    Transport with Decay  
    Nonuniform Transport  
2.3. Nonlinear Transport and Shocks  
    Shock Dynamics  
    More General Wave Speeds  
2.4. The Wave Equation: d'Alembert's Formula  
    d'Alembert's Solution  
    External Forcing and Resonance

### Chapter 3. Fourier Series

3.1. Eigensolutions of Linear Evolution Equations  
    The Heated Ring  
3.2. Fourier Series  
    Periodic Extensions  
    Piecewise Continuous Functions  
    The Convergence Theorem  
    Even and Odd Functions  
    Complex Fourier Series  
3.3. Differentiation and Integration  
    Integration of Fourier Series  
    Differentiation of Fourier Series

- 3.4. Change of Scale
- 3.5. Convergence of Fourier Series
  - Pointwise and Uniform Convergence
  - Smoothness and Decay
  - Hilbert Space
  - Convergence in Norm
  - Completeness
  - Pointwise Convergence

## Chapter 4. Separation of Variables

- 4.1. The Diffusion and Heat Equations
  - The Heat Equation
  - Smoothing and Long Time Behavior
  - The Heated Ring Redux
  - Inhomogeneous Boundary Conditions
  - Robin Boundary Conditions
  - The Root Cellar Problem
- 4.2. The Wave Equation
  - Separation of Variables and Fourier Series Solutions
  - The d'Alembert Formula for Bounded Intervals
- 4.3. The Planar Laplace and Poisson Equations
  - Separation of Variables
  - Polar Coordinates
  - Averaging, the Maximum Principle, and Analyticity
- 4.4. Classification of Linear Partial Differential Equations
  - Characteristics and the Cauchy Problem

## Chapter 5. Finite Differences

- 5.1. Finite Difference Approximations
- 5.2. Numerical Algorithms for the Heat Equation
  - Stability Analysis
  - Implicit and Crank–Nicolson Methods
- 5.3. Numerical Algorithms for First Order Partial Differential Equations
  - The CFL Condition
  - Upwind and Lax–Wendroff Schemes
- 5.4. Numerical Algorithms for the Wave Equation
- 5.5. Finite Difference Algorithms for the Laplace and Poisson Equations
  - Solution Strategies

## Chapter 6. Generalized Functions and Green's Functions

- 6.1. Generalized Functions
  - The Delta Function
  - Calculus of Generalized Functions
  - The Fourier Series of the Delta Function
- 6.2. Green's Functions for One–Dimensional Boundary Value Problems

- 6.3. Green's Functions for the Planar Poisson Equation
  - Calculus in the Plane
  - The Two-Dimensional Delta Function
  - The Green's Function
  - The Method of Images

## Chapter 7. Fourier Transforms

- 7.1. The Fourier Transform
  - Concise Table of Fourier Transforms
- 7.2. Derivatives and Integrals
  - Differentiation
  - Integration
- 7.3. Green's Functions and Convolution
  - Solution of Boundary Value Problems
  - Convolution
- 7.4. The Fourier Transform on Hilbert Space
  - Quantum Mechanics and the Uncertainty Principle

## Chapter 8. Linear and Nonlinear Evolution Equations

- 8.1. The Fundamental Solution to the Heat Equation
  - The Forced Heat Equation and Duhamel's Principle
  - The Black-Scholes Equation and Mathematical Finance
- 8.2. Symmetry and Similarity
  - Similarity Solutions
- 8.3. The Maximum Principle
- 8.4. Nonlinear Diffusion
  - Burgers' Equation
  - The Hopf-Cole Transformation
- 8.5. Dispersion and Solitons
  - Linear Dispersion
  - The Dispersion Relation
  - The Korteweg-de Vries Equation

## Chapter 9. A General Framework for Linear Partial Differential Equations

- 9.1. Adjoints
  - Differential Operators
  - Higher-Dimensional Operators
  - The Fredholm Alternative
- 9.2. Self-Adjoint and Positive Definite Linear Functions
  - Self-Adjointness
  - Positive Definiteness
  - Two-Dimensional Boundary Value Problems

- 9.3. Minimization Principles
  - Sturm–Liouville Boundary Value Problems
  - The Dirichlet Principle
- 9.4. Eigenvalues and Eigenfunctions
  - Self–Adjoint Operators
  - The Rayleigh Quotient
  - Eigenfunction Series
  - Green’s Functions and Completeness
- 9.5. A General Framework for Dynamics
  - Evolution Equations
  - Vibration Equations
  - Forcing and Resonance
  - The Schrödinger Equation

## Chapter 10. Finite Elements and Weak Solutions

- 10.1. Minimization and Finite Elements
- 10.2. Finite Elements for Ordinary Differential Equations
- 10.3. Finite Elements in Two Dimensions
  - Triangulation
  - The Finite Element Equations
  - Assembling the Elements
  - The Coefficient Vector and the Boundary Conditions
  - Inhomogeneous Boundary Conditions
- 10.4. Weak Solutions
  - Weak Formulations of Linear Systems
  - Finite Elements Based on Weak Solutions
  - Shock Waves as Weak Solutions

## Chapter 11. Dynamics of Planar Media

- 11.1. Diffusion in Planar Media
  - Derivation of the Diffusion and Heat Equations
  - Separation of Variables
  - Qualitative Properties
  - Inhomogeneous Boundary Conditions and Forcing
  - The Maximum Principle
- 11.2. Explicit Solutions of the Heat Equation
  - Heating of a Rectangle
  - Heating of a Disk — Preliminaries
- 11.3. Series Solutions of Ordinary Differential Equations
  - The Gamma Function
  - Regular Points
  - The Airy Equation
  - Regular Singular Points
  - Bessel’s Equation
- 11.4. The Heat Equation in a Disk, Continued

- 11.5. The Fundamental Solution to the Planar Heat Equation
- 11.6. The Planar Wave Equation
  - Separation of Variables
  - Vibration of a Rectangular Drum
  - Vibration of a Circular Drum
  - Scaling and Symmetry
  - Chladni Figures and Nodal Curves

## Chapter 12. Partial Differential Equations in Space

- 12.1. The Three-Dimensional Laplace and Poisson Equations
  - Self-Adjoint Formulation and Minimum Principle
- 12.2. Separation of Variables for the Laplace Equation
  - Laplace's Equation in a Ball
  - The Legendre Equation and Ferrers Functions
  - Spherical Harmonics
  - Harmonic Polynomials
  - Averaging, the Maximum Principle, and Analyticity
- 12.3. Green's Functions for the Poisson Equation
  - The Free-Space Green's Function
  - Bounded Domains and the Method of Images
- 12.4. The Heat Equation for Three-Dimensional Media
  - Heating of a Ball
  - Spherical Bessel Functions
  - The Fundamental Solution of the Heat Equation
- 12.5. The Wave Equation for Three-Dimensional Media
  - Vibration of Balls and Spheres
- 12.6. Spherical Waves and Huygens' Principle
  - Spherical Waves
  - Kirchhoff's Formula and Huygens' Principle
  - Descent to Two Dimensions
- 12.7. The Hydrogen Atom
  - Bound States
  - Atomic Eigenstates and Quantum Numbers

## Appendix A. Complex Numbers

## Appendix B. Linear Algebra

- B.1. Vector Spaces and Subspaces
- B.2. Bases and Dimension
- B.3. Inner Products and Norms
- B.4. Orthogonality
- B.5. Eigenvalues and Eigenvectors
- B.6. Linear Iteration
- B.7. Linear Functions and Systems
