

---

This is an open-book, -library, -internet take home exam. You are not allowed to collaborate; I am the only person you are allowed to consult. You can ask questions during office hours, or you can email me at any time during the day.

In a sense the exam is like a homework assignment, but you should treat it with much more care. First, it's worth roughly six times more than a standard homework assignment when everything is weighted to compute course grades. Second, you don't have the pressure of studying for an in-class exam, so you should expect to spend at least as much time working on this as you would have spent studying otherwise.

As always, you should explain your work, writing complete sentences with reasonably correct grammar. A good rule of thumb is that the work you hand in for this exam should not be your first draft. Figure out the problem on another sheet of paper, organize your thoughts, and *then* write out your solution.

**Unless you are told otherwise, you should not use material from a later chapter to solve problems; for example, you should not use results from Chapter 5 to solve a problem from Chapter 4.**

<b>Due: Friday, 11/20/2009 by 2:30pm in my mailbox.</b>

## HOMEWORK ASSIGNMENT

**4.11.43:** (8 Points)

**6.6.57:** (8 Points) (Hint: a dart can be an orthocentric quadrangle.)

**7.9.26:** (6 Points) (I don't care about the restriction to §7.4)

**7.9.27:** (6 Points) (I don't care about the restriction to §7.4)

**7.9.30:** (8 Points) Do parts (i, ii, iv, v). In each part, only do one direction: reflect across the first line, and then across the second. In some cases you can save time by using your knowledge about the composition of reflections to predict the geometric outcome and then write out the corresponding matrix formula.

**7.9.34:** (6 Points)

**8.3.3:** (8 Points)
