Linear Speed and Angular Speed

University of Minnesota Linear Speed and Angular Speed

Preliminaries:

- Circumference of a circle
- Conversion factors (dimensional analysis)

Objectives:

- Given the central angle and radius (or diameter) of a circle, find the arc length
- Given the rotational speed of a tire, find the linear speed of the vehicle.

Finding arc length from radian measure

Find the length of the arc of a circle of radius = 7, where the central angle measures 120°

Find the length of the arc of a circle of radius = 7, where the central angle measures 120°

Arc length = (fraction of circle) x (circumference of circle)

$$C = 2\pi r = 14\pi$$

Arc length
$$=$$
 $\frac{120^{\circ}}{360^{\circ}}(14\pi) \approx 14.661$

Distance moved in one revolution = circumference of circle

Distance moved in one revolution $= 2\pi r = \pi d$

Angle moved in one revolution = $360^{\circ} = 2\pi$ radians.

Distance moved in one revolution $= \pi d = 35\pi \approx 109.956$ inches

Distance moved in one revolution $= \pi d = 35\pi \approx 109.956$ inches

10 revolutions = $10(35\pi) \approx 1099.56$ inches

Distance moved in one revolution $= \pi d = 35\pi \approx 109.956$ inches

10 revolutions = $10(35\pi) \approx 1099.56$ inches

1099.56 inches
$$\cdot \frac{1 \text{ft.}}{12 \text{in.}} \approx 91.63 \text{ ft.}$$

Finding linear speed from angular speed

A car tire has a diameter of 25 inches. If the tire is rotating at 10 revolutions per second, how fast is the car traveling?

Finding linear speed from angular speed

A car tire has a diameter of 25 inches. If the tire is rotating at 10 revolutions per second, how fast is the car traveling?

Solution:

 $d = 25 \Leftrightarrow C = \pi d = 25\pi$ inches \approx 78.54 inches

$$10\frac{\text{rev.}}{\text{sec.}}\approx 10(78.54\frac{\text{in.}}{\text{sec.}})\approx 785.4\frac{\text{in.}}{\text{sec.}}$$

Finding linear speed from angular speed

A car tire has a diameter of 25 inches. If the tire is rotating at 10 revolutions per second, how fast is the car traveling?

Solution:

 $d = 25 \Leftrightarrow C = \pi d = 25\pi$ inches \approx 78.54 inches

$$10 rac{ ext{rev.}}{ ext{sec.}} pprox 10(78.54 rac{ ext{in.}}{ ext{sec.}}) pprox 785.4 rac{ ext{in.}}{ ext{sec.}}$$

 $\frac{785.4 \text{ in.}}{\text{sec}} \cdot \frac{1 \text{ ft.}}{12 \text{ in.}} \cdot \frac{1 \text{ mile}}{5280 \text{ ft.}} \cdot \frac{60 \text{ sec}}{1 \text{ min}} \cdot \frac{60 \text{ min}}{1 \text{ hr}} \approx 44.6 \text{ mi./hr.}$

A tractor is traveling 8 mph. If the tractor tire has a radius of 40 inches, how fast is the tire rotating?

A tractor is traveling 8 mph. If the tractor tire has a radius of 40 inches, how fast is the tire rotating?

Solution:

 $r = 40 \Leftrightarrow C = 2\pi r = 80\pi$ inches ≈ 251.33 inches

$$\frac{8 \text{ mi.}}{\text{hr.}} \cdot \frac{5280 \text{ ft.}}{\text{mi.}} \cdot \frac{12 \text{ in.}}{\text{ft.}} \cdot \frac{\text{hr.}}{60 \text{ min.}} \cdot \frac{1 \text{ rev.}}{251.33 \text{ in.}} \approx 33.6 \text{ rev./min.}$$
